

ABSTRACT OF THE DISCLOSURE

A technique is disclosed for obtaining printed copies in a plurality of different formats such as OHP transparency copies for use by a presenter in a presentation and copies to be distributed among participants in the presentation, simply by a single print job. Input data to be printed is temporarily stored in a memory. First print data to be printed in a first printing format and second print data to be printed in a second printing format are produced from the data stored in the memory. A single set of print data is then produced from the first print data and the second print data.
